Study of the Cytotoxic Effect of New Copper(II) Complexes and Aqueous Extract of Origanum Vulgare L. Plant on Cancer (Cell Line RD)

Saadiyah A. Dhahir, Jinaa H. Murtadha and Iman H. Abdul Razzaq
Department of Chemistry, College of Science for Women, University of Baghdad, Iraq.

Abstract
The new complexes of copper (II) 1,2 where L₁ in complex (1) was 2-Amino-5-[2-amino-5-(3,4,5-trimethoxy-benzyl)-pyrimidinyl-4-azo]-phenol, while L₂ was 2-[2-Amino-5-(3,4,5-trimethoxy-benzyl)-pyrimidinyl-4-azo]-4-bromophenol and aqueous extract of Origanum Vulgare L. plant (after the chemical assay) were studied on the growth on of Rhabdomyosarcoma (RD) cell line in human by using in vitro system and compared with anticancer drug cisplatin (cis-pt) as a positive control. The cancer cells were treated with different concentration (31.25, 62.5, 125, 250)µg/ml for each of the three treatments and cis-pt after 72 hour exposure time. The cytotoxic activity was tested by inhibition rate as parameter. The results showed significant differences (p<0.05) for each three treatments when the inhibition rates were increased. The inhibition levels was reached to 48.13%, 51.75% and 51.63% respectively at 250µg/ml. There was strong correlation between the three treatments and the different concentrations in comparison with cisplatin.

Keywords: Copper(II) complexes, Cytotoxicity cisplatin, Origanum Vulgare.

Introduction
The earliest report on therapeutic use of metals or metals containing compounds in cancer and leukemia data form the sixteenth and nineteenth centuries, cis platin, cis platinum or cis–diaminedichloroplatinum (II) (CDDP) is platinum-based chemotherapy drug used to treat various types of cancers, including sarcomas, some carcinomas, ovarian cancer and lymphomas[1].

Numerous other metal compounds containing platinum, other platinum metals, and even non platinum metals were then shown to be effective against tumors in man and experimental tumors in animals. These compound comprise main-group of gallium, germanium, early transition metals complexes and late transition of ruthenium, rhodium, platinum and copper [2]. Chuan Dong et al [3] studied the anticancer activities of some reported copper complexes of salicylaldehydepyrazolhydrozone (Cu-SPHs) derivatives and they showed antiproliferative activity on growth inhibition to cell line A549. Glutamine Schiff base copper complexes have potential anticancer treatment and prevention [4]. Azo compound have the potential to act as drug carrier that facilitate the selective release of therapeutic agents to colon cancer [5]. Complexes of nickel (II), copper(II) and zinc(II) with thiosemicarbozone were studied on cell proliferation of human leukemia U937 cell lines and indicated the inhibiting of cellular growth[6]. The Ortance, necessity and potentiality of medicinal plants in practices of medicine today well established and cannot be looked, Origanum Vulgare L. belongs to family lamiacean (origanum), oregano(origanum vulgaris, some time listed with Majoram as Origanum majorana) is also called wild majoram, that's native to Europe, the Mediterranean, south and central Asia[7]. The Origanum vulgare plant contain many compounds terpinen, thymol, sabinine, linolool, terpinolene and large amounts of poly phenols, namely flavonoids (Quercetin, apigenin) [8]. Abdel Massih et al [9] studied anti-proliferative activity of plant extracts form Origanum Vulgare on human lymphoblastic leukemia cell line. The objective of this study is to detect the chemical compounds in Origanum Vulgare plant to determine, efficiency of aqueous extract of this plant and two new copper (II) complexes L(1) and L(2) were compared with anti cancer drug cis-platin.
Experimental Work

1- (Cis -platin) (10mg/20ml) drug was provided by Ebew (Austria).

2- New copper(II) complexes L(1) and L(2) were provide by sanna [10]. 10 mg of copper(II) complexes dissolved in 20 ml of normal saline(stock solution) and were stored at(2-8)° C until processing.

3- Aqueous solution extraction of Origanum Vulgare plant which prepared as following method.

The Origanum Vulgare plant were purchased from the local market in Baghdad city. 15 gm of plant were put in to the thimble of soxhlet apparatus which contain 100ml of distilled water in around flask and boiled at 100 °C for 4 hour and mixture were evaporated by using the distillation apparatus to give total weight of component of Origanum Vulgare powder, then 10 mg of powder extract was dissolved in 20 ml of normal saline as a stock solution and stored at (2-8) °C until further used[11].

Phytochemical screening of aqueous extract of origanum vulgare plant were preformed using standard procedure according to the of salman[12]. Test of phenols, steroids ,resins and test of Terpenoids, Alkaloids,Tannis and Saponins according to the method of Ayooola et al[12].

4- Study of cytotoxic effect on cancer cell line.

The method was used to investigated the effect of aqueous extract solution of Origanum Vulgare plant and new copper (II) complexes on Rhabdomyo Sarcomase (RD) in human cell line was provided by center of biotechnology research center of Al-Naharin university. All solutions are prepared at the same center and culturing tissues were studied in vitro under optimum conditions by the same center. The growth media used in tissue culture technique was MEM (Minimum Essential Media) was provided by Fetal Calf Serum (10%) to form a confluent monolayer, then Subculture to discard the previous growth medium and the cells washed with sterilized phosphate buffer solution(PBS) by autoclave at 121 °C for 15 min and addition 2-3ml of trypsin-versene solution was added for 3-5 min and moving the culture flask kindness. The trypsin-versene solution to discard and cells incubated at 37 °C until the cell separation from ground flask, added new growth media and redistribution of cells at the microtiter and incubated at 37 °C[13].

Cytotoxicity Assay

The it is also called a cell growth inhibition assay. In this assay, the cell line (RD) was treated with aqueous extract, new copper complexes and cisplatin by using four concentrations (31.25, 62.5, 125, 250) µg/ml. Immediately by adding of 25ml trypsin-versene solutions in to culture bottle and 20 ml of culture medium which contains 10% of serum to provide the suspend cells, mixed very well and addition of 0.2ml to each microtiter. The plates were incubated at 37 °C for 24 hour until to form monolayer, then the previous culture medium which present in to the plates to discard 0.2 ml of compounds under study were added and these three Preparation repeated as negative control (cancer cell line RD with buffer solutions) and incubated at 37 °C for 72 hour exposure time. The culture medium to discard from micro liter plates, about 0.2ml of crystal violet solution was added to wells and the plates were incubated for 20 min at 37 °C. The plates were washed gently with distilled water and left to dry. In the end of assay the plates were examined by ELISA reader at 492nm transmitting wave length. Only viable cells were able to take a stain while the dead cells were not. The inhibition rate was measured according to Gao et al [14] and as follows:

\[
\text{Inhibition rate} \% = \frac{\text{Absorbance of negative control} - \text{Absorbance of Test}}{\text{Absorbance of negative control}} \times 100
\]

Statistical Analysis

Data were analyzed by analysis of variance ANOVA. Investigation of differences between cis-platin and the relation with other groups by toward using the statistical program (SPSS) within significant level (p<0.05) [15].

Results and Discussion

-Phytochemical (screening of plant materials) of the Origanum Vulgare studied the result are presented in Table (1).

According to the results showed in Table (1) the aqueous extract of *Origanum vulgare* plant contains Flavonoids, Phenols, Terpenoids and tannins, etc.

The increased of inhibition rates when cancer cells treated with extract plant at different concentrations could be attributed to the Flavonoids such as Apigenin, Luteolin and Quercetin which have a cytotoxic effects on growth cancer cell line in vitro and in vivo systems, therefore used as anticancer therapy [16].

The *origanum vulgare* extract exhibit antiproliferative effect and high antioxidant activity, due to a high content of Phenolic acids and Flavonoids [7,9].

Tannins compounds in aqueous extract which led apoptosis and stopped one of cell cycle phases (G1, S, G2) on cancer cells [16]. Sadeghi et al. [17] were studied the inhibition effect of Terpenoids in *Dophne mucronata* plant on human Myelogenous leukemia cell line K562 and has been found the cell cycle stopped in G1 phase.

Study of Cytotoxic Effects

The inhibition rates of cancer cells which treated with two new copper (II) complexes 1,2 and aqueous *Origanum vulgare* extract were studied on cancer cell line (RD) with different concentrations comparable with anticancer drug cis platin as a positive control after 72 hours exposure time.

The results showed significant differences (p<0.05) with concentrations increased for three treatments comparison with positive control, the inhibition rates were reached to (48.13% and 51.7%) when the cancer cells were treated with two new copper (II) complexes 1-2 respectively. While the inhibition rate of aqueous extract was reached to 51.63% at 250µg/ml was similar to effect of copper (II) complexes 1-2 with cis-platin drug. The result which showed no significant differences between aqueous extract and a new copper (II) complexes in different concentrations as shown in Table (2).

As shown in Fig.(1), the inhibition rate of cancer cells treated with copper(II) complex (1) was similar to copper complex (2) for four concentrations after 72 hour exposure time comparable with cis–pt.

**Table (3) The correlation (p< 0.05) between all concentrations and each Group (new complexes CuL(1), CuL(2),aqueous extract and cis-platin) and between the same Groups.**

**R=Correlation Factor.**

The results in the Table (2) and Fig.(1) shows an evidence that new copper complexes have cytotoxic effect on cancer cell line by elevated of inhibition rates with concentration increased, this effect was similar to effect of anti-cancer drug cis-platin. In this study, we suggest the azo ligand in a new copper (II) complexes have inhibition effect, this effect was similar to Tsuda et al [18] studied on colon and liver cancer in miceand result in DNAdamge after shortly administration of relatively high dose, while carcinogenicity was detected after prolong treatment with low doses .Kenyon et al [19] showed the type of organic ligand (bis-8-hydroxyquinolin) coupled to tumor cellular copper forming potent protoseasome inhibitors and apoptosis inducers at copper concentration found in tumor tissues.

This study similar to our results which rised the inhibition rates with elevation of concentration. The new copper (II) complexes was similar effect to cis-platin that could be attributed to the cis-platin binding to and cross linking of DNA which ultimately triggers opoptosis (programmed cell death) [20].

**Conclusions**

The study showed the new copper (II) complexes and aqueous *origanum vulgare* extract have a cytotoxic effect on RD for four concentrations through exposure time 72 hour by increasing inhibition rates at high concentration 250 µg/ml, these effects were similar to effect of anticancer drug cis–platin.
